Historical introduction. The concept of chemical equilibrium was developed in 1803, after Berthollet found that some chemical reactions are reversible. For any reaction mixture to exist at equilibrium, the rates of the forward and backward (reverse) reactions must be equal. In the following chemical equation, arrows point both ways to indicate equilibrium.

Balance within muscle groups and alignment of the skeletal system affect body equilibrium and balance. Small shifts of bones can affect the whole skeletal system. When the bite of the jaw is off or one leg is longer than the other, the entire spine compensates for the misalignment.

Equilibrium, in physics, the condition of a system when neither its state of motion nor its internal energy state tends to change with time. A simple mechanical body is said to be in equilibrium if it experiences neither linear acceleration nor angular acceleration; unless it is disturbed by an outside force, it will continue in that condition indefinitely.

In fluid mechanics, hydrostatic equilibrium or hydrostatic balance (also known as hydrostasy) is the condition of a fluid or plastic solid at rest. This occurs when external forces such as gravity [citation needed] are balanced by a pressure-gradient force. For instance, the pressure-gradient force prevents gravity from collapsing Earth's atmosphere into a thin, dense shell, whereas gravity ...

1. The Method of Reflective Equilibrium. The method of reflective equilibrium consists in working back and forth among our considered judgments (some say our "intuitions," though Rawls (1971), the namer of the method, avoided the term "intuitions" in this context) about particular instances or cases, the principles or rules that we believe govern them, and the theoretical ...

Equilibrium happens when a chemical reaction does not convert all reactants to products: many reactions reach a state of balance or dynamic equilibrium in which both reactants and products are present.. Another way of defining equilibrium is to say that a system is in equilibrium when the forward and reverse reactions occur at equal rates.. Equilibrium does not necessarily mean that reactants ...

The atmosphere's basic pressure structure is determined by the hydrostatic balance of forces. To a good approximation, every air parcel is acted on by three forces that are in balance, leading to no net force. Since they are in balance for any air parcel, the air can be assumed to be static or moving at a constant velocity.
