Any Perl/Tk application starts by creating the Tk MainWindow. You then create items inside the MainWindow, and/or create new windows called Toplevel s that also contain child items, before starting the MainLoop, which is the last logical statment in your program. You can also create more items and windows while you're running, using callbacks.

Tk is a GUI toolkit tied to the Tcl language, and Tkx provides a bridge to Tcl that allows Tk based applications to be written in Perl. The main idea behind Tkx is that it is a very thin wrapper on top of Tcl, i.e. that what you get is exactly the behaviour you read about in the Tcl/Tk documentation with no surprises added by the Perl layer.

As usual, the answer can be found in the online Perl/Tk documentation. The documentation for every Perl/Tk widget contains a section titled "Default Bindings." Here's what it tells us about buttons: A button activates whenever the mouse passes over it and deactivates whenever the mouse leaves the button.
